

Learning machines

Ne assume the model to be a specific instance of a given learning machine

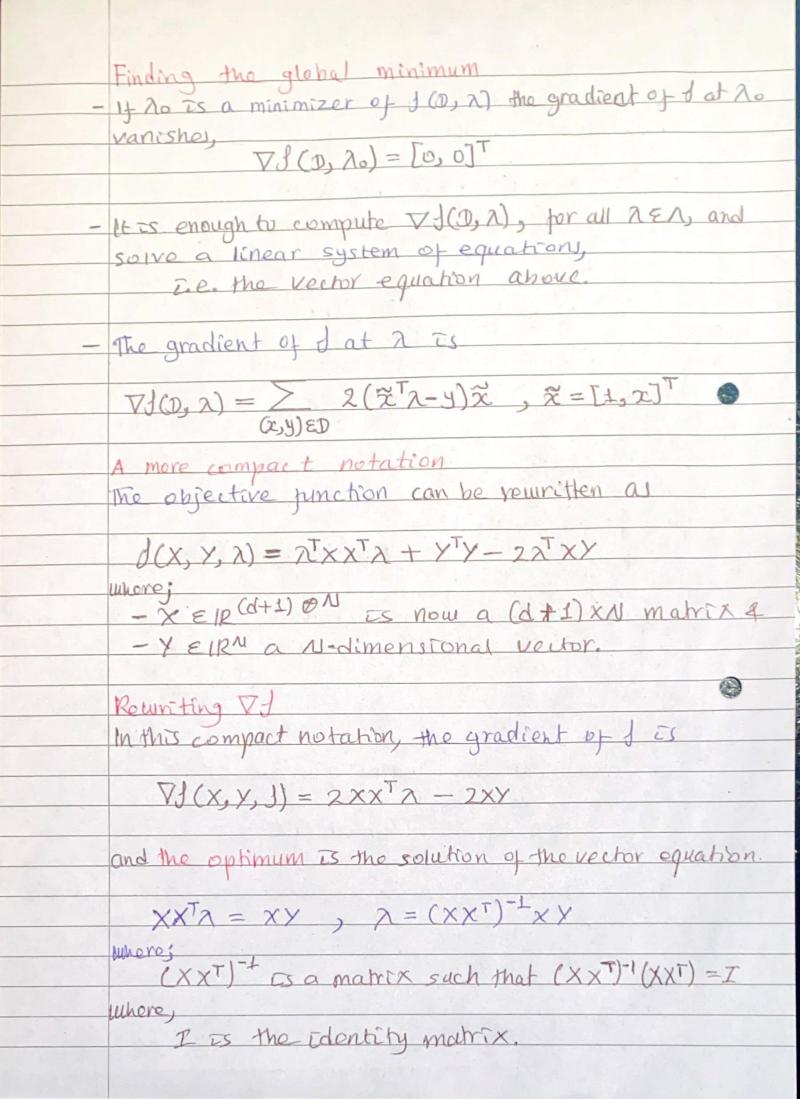

F: Xx A -> Y. · This weet we consider 3 parametric learning machines I. Imear regression models
Whore; > X & IRd > A & IRd+1 & YEIR (regression) 2. logistic regression models

where; > X = IRd -> X = \(\frac{1}{2} \) (classification)

> \(\text{2. Lipd+1} \) 3. neural network models where; > x = 1pd and = y \in IR or y \in 1,000 K

7 \(\gamma \) | 7 \(\text{Cregression or classification} \) the obtain the corresponding models I.e. $f(x) = F(x, \lambda), \lambda \in \Lambda$ -using labelled data sets DND (supervised learning) inear regression let x=y=IR and NEIR. - A linear regression learning machine Is $F(x,\lambda) = \lambda_0 + \lambda_1 x, \quad \lambda \in \Lambda = |R^2|$ - Given à, predictions will be made by pollowing the straight line $\hat{f}(x) = \hat{\lambda}_0 + \hat{\lambda}_1 x = \tilde{x}^T \hat{\lambda} = (\tilde{x}^T, \hat{\lambda}), \quad \tilde{x} = [1, 2]^T$ The dimensionality of A measure - the flexibility of the model C.e. its degrees of treadom.

Least Squares training · We train the model by minimizing the Empirical Risk, 2. e. the RSS of the training set D For F:12 x122 -> 12 me have $\hat{\lambda} = \underset{\lambda \in IR^2}{\text{arg min}} \sum_{(x,y) \in D} (F(x,x)-y)^2$ $\lambda = arg min > (\lambda_0 + \lambda_1 x - y)^2$ $\lambda \in \mathbb{R}^2 : (x,y) \in D$ In this case, & is usually called least squares parameter. · The Empirical Rick - Is an approximation of the Cunavailable) -expected test error $E_{\mathcal{D}}((\hat{f}(x)-Y)^2)$ Example: A synthetic data set generated by adding Gaussian noise, ê.e. & ~ A) (O, OE), to a linear model Imue (x) = xT2 mue A 2-dimensional parabola For linear regression learning machines, - the least squares objective $J(D,\lambda) = \sum_{(x,y) \in D} (\lambda_0 + \lambda_1 x - y)^2$ has a nice shape and finding its global minimum (a) Es easy.

The matrix formulation applies to any linear regreemodel - with $X \in \mathbb{R}^d$, $\lambda \in \mathbb{R}^{d+1}$ and $d \neq 2$ In $d = 2$, the vector equation can be written down components and you obtain the system of equation $\hat{\lambda}_1 = \sum_{i=1}^{2} (x_i - \bar{x})(y_i - \bar{y})$ $\hat{\lambda}_0 = \bar{y} - \hat{\lambda}_1 \bar{x}$ $\hat{\lambda}_1 = \sum_{i=1}^{2} (x_i - \bar{x})(y_i - \bar{y})$ $\hat{\lambda}_0 = \bar{y} - \hat{\lambda}_1 \bar{x}$ Where: $\hat{\lambda}_1 = \sum_{i=1}^{2} (x_i - \bar{x})(y_i - \bar{y})$ $\hat{\lambda}_0 = \bar{y} - \hat{\lambda}_1 \bar{x}$ $\hat{\lambda}_0 = \bar{y} - \hat{\lambda}_1 \bar{x}$ Where: $\hat{\lambda}_1 = \sum_{i=1}^{2} (x_i - \bar{x})(y_i - \bar{y})$ $\hat{\lambda}_0 = \bar{y} - \hat{\lambda}_1 \bar{x}$ Where: $\hat{\lambda}_1 = \sum_{i=1}^{2} (x_i - \bar{x})(y_i - \bar{y})$ $\hat{\lambda}_0 = \bar{y} - \hat{\lambda}_1 \bar{x}$ $\hat{\lambda}_0 = \bar{y} - \hat{\lambda}_1 \bar{x}$ Where: $\hat{\lambda}_1 = \sum_{i=1}^{2} (x_i - \bar{x})(y_i - \bar{y})$ $\hat{\lambda}_0 = \bar{y} - \hat{\lambda}_1 \bar{x}$ $\hat{\lambda}_0 = \bar{y} - \hat{\lambda}_1 x$	Higher	dimensions
- with $X \in IR^d$, $\lambda \in IR^{d+1}$ and $d \neq 2$ In $d = 2$, the vector equation can be written down components and you obtain the system of equation $\hat{\lambda}_1 = \sum_{z=1}^{\infty} (x_z - \bar{x})(y_z - \bar{y}) \hat{\lambda}_0 = \bar{y} - \hat{\lambda}_1 \bar{x}$ $\sum_{z=1}^{\infty} (x_z - \bar{x})^2$ Where: $- \bar{x} = D ^{-1} \sum_{z=1}^{\infty} x \approx E(x) \text{and} (x,y) \in D$ $- \bar{y} = D ^{-1} \sum_{z=1}^{\infty} y \approx E(y)$ $(x,y) \in D$ Example (1) Show that the formula in the previous stides are equivalent to the vertex equation $\nabla J = 0$ that we $\nabla J = \sum_{z=1}^{\infty} 2(\lambda_0 + x\lambda_1 - y)$ $(x,y) \in D$ $\nabla J = \sum_{z=1}^{\infty} 2(\lambda_0 + x\lambda_1 - y)$ and $\nabla u \cdot (x) = D ^{-1} \sum_{z=1}^{\infty} (x - \bar{x})^2 = D ^{-1} \sum_{z=1}^{\infty} x^2 - \bar{x}^2$	- The matri	
In $d=2$, the vector equation can be written down components and you obtain the system of equation $\hat{\lambda}_1 = \sum_{z=1}^{2} (x_z - \bar{x})(y_z - \bar{y})$ $\hat{\lambda}_0 = \bar{y} - \hat{\lambda}_1 \bar{x}$. $\hat{\lambda}_1 = \sum_{z=1}^{2} (x_z - \bar{x})^2$ Where: $-\bar{x} = D ^{-1} \sum_{z=1}^{2} x \approx E(x) \text{ and } (x_y) \in D$ $-\bar{y} = D ^{-1} \sum_{z=1}^{2} y \approx E(y)$ $(x_y) \in D$ Example (1) Show that the formular in the previous slider are equivalent to the vertex equation $\nabla J = 0$ that: use $[\nabla J]_0 = \sum_{z=1}^{2} x(\lambda_0 + x\lambda_1 - y)$. $[\nabla J]_1 = \sum_{z=1}^{2} x(\lambda_0 + x\lambda_1 - y)$ and $Var(x) = D ^{-1} \sum_{z=1}^{2} (x_z - \bar{x})^2 = D ^{-1} \sum_{z=1}^{2} x^2 - \bar{x}^2$	model	V - d · \d+t
Components and you obtain the system of equation $\hat{\lambda}_1 = \sum_{z=1}^{n} (x_z - \overline{x})(y_z - \overline{y})$ $\hat{\lambda}_0 = \overline{y} - \hat{\lambda}_1 \overline{x}$. $\frac{1}{2} (x_z - \overline{x})^2$ Where: $-\overline{x} = D ^{-1} > x \approx E(x) \text{ and } (x,y) \in D$ $-\overline{y} = D ^{-1} > y \approx E(y)$ Example (1) Show that the formula in the previous stides are equivalent to the vertor equation $\nabla J = 0$ thint: use $[\nabla J]_0 = \sum_{(x,y) \in D} 2(\lambda_0 + x\lambda_1 - y)$. $[\nabla J]_1 = \sum_{(x,y) \in D} 2(\lambda_0 + x\lambda_1 - y)$ and $Var(x) = D ^{-1} > (x - \overline{x})^2 = D ^{-1} > x^2 - \overline{x}^2$	- min	1 XEIR, AEIR and 172
$ \frac{\lambda_{1} = \sum_{z=1}^{n} (x_{z} - \overline{x})(y_{z} - \overline{y})}{\sum_{z=1}^{n} (x_{z} - \overline{x})^{2}} $ Where: $ -\overline{x} = D ^{-1} \sum_{z=1}^{n} x \approx E(x) \text{ and } $ $ (x,y) \in D $ $ -\overline{y} = D ^{-1} \sum_{z=1}^{n} y \approx E(y) $ $ (x,y) \in D $ Example (1) Show that the formula in the previous slides are equivalent to the vertor equation $\nabla J = 0$ thint: use $[\nabla J]_{0} = \sum_{z=1}^{n} 2(\lambda_{0} + x\lambda_{1} - y)$. $ (x,y) \in D $ $ [\nabla J]_{1} = \sum_{z=1}^{n} 2(\lambda_{0} + x\lambda_{1} - y)$ $ (x,y) \in D $ and $ Var(x) = D ^{-1} \sum_{z=1}^{n} (x - \overline{x})^{2} = D ^{-1} \sum_{z=1}^{n} x^{2} - \overline{x}^{2}$	$-\ln d = 2g$	the vector equation can be written down in
Where; $\overline{x} = 10^{-1} \sum x \approx E(x)$ and $(x,y) \in D$ $-\overline{y} = 10^{-1} \sum y \approx E(x)$ $Cxy) \in D$ Example (1) Show that the formula in the previous stides are equivalent to the vertex equation $\nabla J = 0$ thint: use $[\nabla J]_0 = \sum_{(x,y) \in D} 2(\lambda_0 + x\lambda_1 - y)$ $Cxy) \in D$ [$\nabla JJ_1 = \sum_{(x,y) \in D} 2(\lambda_0 + x\lambda_1 - y)$ $Cxy) \in D$ and $Var(x) = 10^{-1} \sum (x-\overline{x})^2 = D ^{-1} \sum x^2 - \overline{x}^2$		0
Where: $-\overline{\chi} = D ^{-1} > \chi \approx E(\chi) \text{ and}$ $-\overline{y} = D ^{-1} > y \approx E(\chi)$ $C_{3}y) \in D$ Example (1) Show that the formular in the previous stides are equivalent to the vertex equation $\nabla J = 0$ What: use $[\nabla J]_D = \sum_{(x,y) \in D} 2(\lambda_0 + \chi \lambda_1 - y)$. $C_{3}y) \in D$ $[\nabla J]_{\frac{1}{2}} = \sum_{(x,y) \in D} 2(\lambda_0 + \chi \lambda_1 - y) \times C_{3}y) \in D$ and $Var(\chi) = D ^{-1} > (\chi - \overline{\chi})^2 = D ^{-1} > \chi^2 - \overline{\chi}^2$	24 =	$\sum_{z=1}^{\infty} (x_z - \overline{x})(y_z - \overline{y}) \hat{\lambda}_0 = \overline{y} - \hat{\lambda}_1 \overline{x}$
$-J = D ^{-1} \sum y \approx E(y)$ $Example D$ Show that the formular in the previous slider are equivalent to the vertor equation $\nabla J = 0$ $Example D$ Exa		$\frac{1}{2}(x_{\bar{i}}-\bar{x})^2$
$-J = D ^{-1} \sum y \approx E(y)$ $Example D$ Show that the formular in the previous slider are equivalent to the vertor equation $\nabla J = 0$ $Example D$ Exa	Where:	1-1
$-J = D ^{-1} \sum y \approx E(y)$ $Example D$ Show that the formular in the previous slider are equivalent to the vertor equation $\nabla J = 0$ $Example D$ Exa	- ā	$= D ^{-1} \sum_{(x,y) \in D} x \approx E(x) \text{ and}$
Example (1) Show that the parmular on the previous stides are equivalent to the vertor equation $\nabla J = 0$ Hint: use $[\nabla J]_0 = \sum_{(x,y) \in \mathcal{D}} 2(\lambda_0 + x\lambda_1 - y)$. $[\nabla J]_1 = \sum_{(x,y) \in \mathcal{D}} 2(\lambda_0 + x\lambda_1 - y)x$ and $Var(x) = \mathcal{D} ^{-1} \sum_{(x-\bar{x})^2} = \mathcal{D} ^{-1} \sum_{(x-\bar{x})^2} x^2 - \bar{x}^2$	- 9 =	$= D ^{-1} \sum y \approx E(x)$
Example (1) Show that the parmular on the previous stides are equivalent to the vertor equation $\nabla J = 0$ Hint: use $[\nabla J]_0 = \sum_{(x,y) \in \mathcal{D}} 2(\lambda_0 + x\lambda_1 - y)$. $[\nabla J]_1 = \sum_{(x,y) \in \mathcal{D}} 2(\lambda_0 + x\lambda_1 - y)x$ and $Var(x) = \mathcal{D} ^{-1} \sum_{(x-\bar{x})^2} = \mathcal{D} ^{-1} \sum_{(x-\bar{x})^2} x^2 - \bar{x}^2$	1:	(x,y) ED
Show that the formula in the previous slides are equivalent to the vertor equation $\nabla J = 0$ Hint: use $[\nabla J]_0 = \sum_{(x,y) \in \mathcal{D}} 2(\lambda_0 + x\lambda_1 - y)$. $[\nabla J]_1 = \sum_{(x,y) \in \mathcal{D}} 2(\lambda_0 + x\lambda_1 - y)x$ and $Var(x) = \mathcal{D} ^{-1} \sum_{(x-\bar{x})^2} = \mathcal{D} ^{-1} \sum_{(x-\bar{x})^2} x^2 - \bar{x}^2$		
equivalent to the vertor equation $\nabla J = 0$ Hint: use $[\nabla J]_D = \sum_{(x,y) \in D} 2(\lambda_0 + x\lambda_1 - y)$. $[\nabla J]_1 = \sum_{(x,y) \in D} 2(\lambda_0 + x\lambda_1 - y)x$ and $Var(x) = D ^{-1} \sum_{(x-\bar{x})^2} D ^{-1} \sum_{(x-\bar{x})^2} x^2 - \bar{x}^2$	Show that	the formula in the previous stides are
	Hint: use	$[\nabla J]_0 = \sum_{(\lambda_0 + \chi \lambda_1 - y)} 2(\lambda_0 + \chi \lambda_1 - y)$
and $Var(x) = D ^{-1} \sum (x-\bar{x})^2 = D ^{-1} \sum x^2 - \bar{x}^2$		
and $Var(x) = D ^{-1} \sum (x-\bar{x})^2 = D ^{-1} \sum x^2 - \bar{x}^2$		044)ED
$Var(x) = D ^{-1} \ge (x-\bar{x})^2 = D ^{-1} \ge x^2 - \bar{x}^2$	and	
	^	$x = D ^{-1} > (x - \bar{x})^2 = D ^{-1} > x^2 - \bar{x}^2$
	*41	

Example show that the same primulas can be obtained from the matrix equation $\lambda = (xx^{T})^{-1}xx$ using. $XX^{T} = \sum \begin{pmatrix} \widehat{X}_{0}^{2} & \widehat{Z}_{0}\widehat{X}_{1} \end{pmatrix} \qquad XY = \sum \begin{pmatrix} \widehat{Z}_{0}Y \\ \widehat{X}_{1}Y \end{pmatrix}$ $(X,Y) \in \mathbb{D} \begin{pmatrix} \widehat{X}_{0}^{2} & \widehat{X}_{1} \\ \widehat{X}_{1}Y \end{pmatrix} \qquad (X,Y) \in \mathbb{D} \begin{pmatrix} \widehat{X}_{0}Y \\ \widehat{X}_{1}Y \end{pmatrix}$ and the definition of the inverse matrix.

Hint: por 222 marrices one has onverse, i.e. A-1

Extension: polynomial regression Linear regression models -can be extended for capturing possible polynomial dependencies. · The attribute vector X = X - Is extended to include higher powers of Ets entres, e.g. X = [xo, X1, ooo, Xd] -> Xext = [Xo, X1, ooo, Xd, X2, x3] The parameter space is adapted accordingly,
e.g. A -> Next = 1224+1 and
the rearning process is an in the linear case. Extension: nominal attributes e linear regression models -can be extended for accepting at the same time continuous and nominal attributes, e.g. x = C x IR with C = {blue, red, yellow? o XIEC Is a true nominal variable.

i.e. there is no underlying ordering, and it does not make sense to replace C with £1,2,33 or similar. The idea is to replace the nominal variable, X18C, with ICI-1 boolean variables e.g. X1 > [xb, Xr] $X_b = 1[X = yellow], X_r = 1[X = red]$ · As the number of numerical attributes is now 1x=1d+1C1-2 the parameter space should also expanded. o For X = Cx IR with C = Eblue, red, xellow 3 the learning machine becomes

F(Xxx) = No tAbXb+ArXr+ AzXz

As a result, we train base modely Jellow (X2) = No + N2 X2, Which is valid only for the yellow objects and two shifted models, Fred (X2) = Fyellow + Ar & folice (X2) = fyellow + Ab - are valid for the remaining red & blue objects.
